

PRD: Due-date reminders with one-tap actions (Riverty Card)

Title	Due-date reminders with one-tap actions
Author	Me (Product Manager)
Status	Draft
Target	High-Fidelity Prototype

Numbers marked (placeholder) are assumptions, because the 2023 research has no baseline for them.

1. The big picture

Vision

Heavy online shoppers never have to remember what is due on their Riverty Card, and can settle it in one tap at the moment they decide to.

Press release

Riverty today introduced due-date reminders for the Riverty Card. Frequent Riverty shoppers (five or more purchases a year) use pay-later to get their goods before they pay, and in our interviews some said they don't want to forget a payment, kept budget books, or paid within days just to stay on top of it. Now the card tells them before it matters.

Three days before a card invoice is due, the Riverty app sends a reminder showing the shop, the amount and the due date. One tap opens that invoice, and one biometric confirmation pays it from the linked bank account. Once it is paid, the reminders stop.

Success metrics

Both are measured after launch. The prototype itself is judged only by the Evals in section 3.

- **Primary:** share of activated cardholders who make a second card purchase within 30 days of their first, at least 50% (placeholder).
- **Guardrail:** integrated checkout volume per heavy user at partner merchants. Stop if it drops more than 5% against a matched group (placeholder). Moving the same purchases onto the card swaps a 1.54% merchant fee for 0.1% interchange, taking contribution margin from 1.3% to -0.1%.

2. The details

User stories

Story 1: Know what is due

As a heavy Riverty user with an open card invoice, **I want** a reminder before it is due **so that** I don't have to track it in my head or in a budget book.

- Reminder arrives 3 days before the due date at 09:00 local time (placeholder).
- It shows merchant, amount and due date, and tapping it opens that invoice.

Story 2: Pay in one tap

As a user who has decided to pay, **I want** to pay in one tap from the reminder **so that** I act at the moment I decide, not hours later.

- Reminder to confirmed payment takes at most 2 user actions: tap Pay now, confirm biometric.
- The amount and due date are visible on the confirm step.
- Median time from notification tap to confirmation is 10 seconds or less (placeholder).

Story 3: Trust the next reminder

As a user who already paid, I **want** reminders to stop **so that** I can trust the next one.

- After payment the status is Paid and no further reminder is sent for that invoice.
- Opening an old reminder shows Paid with no Pay button.

Screens to build (exactly 3)

Screen 1: Entry point, lock-screen reminder

- Rivery app name and icon
- Title "Payment due in 3 days"
- Body: merchant, amount in EUR, due date
- Two actions: "Pay now" and "Open invoice"

Screen 2: Feature core, invoice detail

- Status chip (Unpaid or Paid)
- Merchant name, amount (large), due date with "Due in X days"
- Payment source: bank account ending in four digits (pre-filled, not editable)
- Primary button "Pay €X now"
- Biometric confirm sheet showing the amount and due date
- Error banner area

Screen 3: Success, confirmation

- Checkmark and "Paid"
- Amount, merchant, date and time paid
- Payment source
- Line: "No more reminders for this invoice"
- "Done" button, which resets the prototype

Functional requirements

ID	Rule	Measure
FR1	One reminder per unpaid card invoice, 3 days before due at 09:00 local (placeholder)	Exactly 1 per invoice; 0 duplicates in 10 scripted scenarios
FR2	Reminder shows merchant, amount (EUR, 2 decimals), due date (DD.MM.YYYY)	3 of 3 fields present, from fixed templates
FR3	Tapping the reminder opens that invoice with no intermediate screen	Correct invoice in 100% of runs, including with 2 open invoices
FR4	"Pay now" on the reminder and on invoice detail; source pre-filled; no form fields	At most 2 user actions to confirmed payment
FR5	Confirm step shows amount and due date; the amount charged equals the amount on screen	0 mismatches
FR6	On success, status is Paid and that invoice's scheduled reminders are cancelled	0 reminders after payment; status updates within 1 second
FR7	On failure or cancellation, invoice stays Unpaid and the reminder schedule is unchanged	100% of seeded failures leave status Unpaid; retry in 1 tap
FR8	Reminders are sent only if notifications are allowed; no fallback channel	0 sent when denied

Smart behaviors

Situation	Outcome
Invoice unpaid, 3 days before due, notifications on	Send the reminder (FR1, FR2)
User taps the reminder body	Open Screen 2 with "Pay €X now" as the primary action
User taps "Pay now" on the reminder	Open Screen 2 with the biometric confirm sheet already showing
Biometric confirmed and payment accepted	Show Screen 3, status Paid, reminders cancelled
Biometric cancelled or failed	Stay on Screen 2, status Unpaid, message "Payment not made. Your due date is unchanged."; retry in 1 tap
Reminder opened after the invoice was paid	Screen 2 in Paid state, no Pay button

Technical constraints (what not to build)

- **No external APIs:** no real push service, bank connection, payment provider or analytics.
- **No login or sign-up:** the prototype opens already signed in, and the biometric prompt is simulated by a Confirm button.
- **useState only:** no router, context, localStorage or backend. The current screen is one state variable.
- **One hard-coded mock invoice** (fictional merchant, €89.90, due in 3 days).
- **No real timers:** a dev-only scenario switcher triggers the states above.

3. The logistics

Features out (from WON'T HAVE)

Excluded	Why
Postpone or split from the reminder	Needs pricing and credit-policy sign-off; the postponement fee was 1 euro in the 2023 prototype
Return-aware pause, return-window reminders	Open-loop card has no order-level data; separate feature
Reminders for integrated-checkout invoices	Protects the guardrail base
Cross-provider due dates	We can't see Klarna or PayPal
Late fees, dunning, overdue flows	Touch credit policy
New pricing, instalments or credit terms	Each needs its own regulatory approval
Cashback, upsell or marketing in reminders	Dilutes the message and pushes spend onto the card
Overview, balance, limit, automatic payment	Other features
Markets outside Germany, in-store handling	Out of scope for the persona

Edge cases and unhappy paths

Case	Handling
Bank declines the payment	Stay Unpaid; banner "Your bank did not accept the payment. Your due date is unchanged."; retry only, no postpone or credit offer
Notifications denied	No reminder, no fallback
No connection	"No connection. Try again." Invoice unchanged
Two invoices due the same day	Two separate reminders, each opening its own invoice; no combined payment
Amount changed after the reminder	Screen 2 shows the current amount with "Amount updated since your reminder"; payment uses the on-screen amount only
Past the due date	Show "Was due [date]"; Pay stays available; no fee or credit statements
Merchant, amount or date missing	Fail closed: send no reminder

Safety guard. All reminder copy comes from fixed templates with slots filled from the invoice record. Nothing is generated, so there are no invented amounts and no claims about SCHUFA, credit scores or fees. Pay always executes the amount shown on the confirm step.

Decision log

1. Pay now only; postpone moved to SHOULD

Postponement matches "timing follows what they decided" more closely, but it carries a fee and needs pricing and risk approval that the sprint can't secure. Reopen if the existing invoice flow already supports postponement under current terms.

2. Card invoices only

Existing reminders for integrated-checkout invoices stay untouched. Changing them risks the guardrail and Riverty's merchant-first positioning, and it adds regression work for a team of four.

Evals

Target	Pass mark
Accuracy	0 mismatches between reminder, invoice detail and charged amount across 10 scripted scenarios (4 happy, 6 unhappy)
Time-on-task	Median 10 seconds or less (placeholder) from reminder tap to confirmed payment, with at least 80% finishing unaided (placeholder). Test with 5 to 8 heavy-user-like participants; with a sample that small, treat results as directional
Safety triggers	Fail-closed rules fire in 100% of seeded fault cases (missing field, amount changed, already paid), with 0 payments made on an unconfirmed amount and 0 reminders after payment
